CSC 530/730 –Programming and Data Structures

W1 Exercise 4

Basic Sorting Algorithms

Problem 1

In example project *Example04BasicSorting*, write a function that removes duplicates from the array. For example, given an unsorted array containing

```
8 5 12 15 7 3 8 15 30 15
```

After calling the function, the array will become

```
3 5 7 8 12 15 30
```

Hint:
- Sorting the array can help place duplicated elements together in adjacent spots in the array.

Submission

NO submission is needed.
